ADQM DATA REVIEW NARRATIVE

Site Chemours CWK – Chambers Works

Project SALEM CANAL BULK SEDIMENT 2015

Project Reviewer Michael Aucoin

Sampling Date November 18 - 25, 2015

Analytical Protocol

<u>Laboratory</u>	<u>Analytical</u>	<u>Parameter(s)</u>
Eurofins Lancaster Labs (Lancaster)	SW 846 8260B	Volatile Organics
Lancaster	SW 846 8270C	Semivolatile Organics
Lancaster	SW 846 9060A MOD.	Total Organic Carbon
Lancaster	SW 846 9060A	Total Organic Carbon
Lancaster	SM 2540 G-1997	Percent Moisture

Additional project samples collected for analysis of radiomarkers and radioisotope cores are not included in this discussion.

Sample Receipt

The following items are noted for this data set:

- All sediment and blank samples were received in satisfactory condition and within EPA temperature guidelines on November 18 - 25, 2015.

Data Review

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Select semivolatile organic non-detect results are qualified R and considered to be unusable due to very poor relative percent recovery (RPR) values in the associated lab control spike (LCS), lab control spike duplicate (LCSD), matrix spike (MS), and/or matrix spike duplicate (MSD) analyses.
- Some additional analytical results have been qualified in the database. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

Attachments

The DVM Narrative report is attached. The laboratory summary level reports are stored on a network drive.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

Lab Qualifier is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

DVM Narrative Report

Sampling Program: SALEM CANAL BULK SEDIMENT 2015

Validation Options: LABSTATS

Validation Reason Code: Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values below the data rejection level. The reported non-detect result is unusable.

Field Sample ID	Date Sampled	Lab Sample ID	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep
SCD-EB-112515	11/25/2015	8151273	Parathion	2	UG/L	MDL	2	5	R	8270C		3510C
SCD-EB-112515	11/25/2015	8151273	Pentachlorobenzene	0.5	UG/L	MDL	0.5	1	R	8270C		3510C

Validation Reason Code: Associated MS and/or MSD analysis had relative percent recovery (RPR) values less than the rejection level. The reported result may be biased low.

Field Sample ID	Date Sampled	Lab Sample ID	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep
SCD-144-2.0-2.5	11/23/2015	8147498	Fluoranthene	120	UG/KG	MDL	10	53	J	8270C		3546

Validation Reason Code: The result is estimated since the concentration is between the method detection limit and practical quantitation limit.

FROM: Candia A. Carle

**RE: SALEM CANAL PORE WATER SAMPLING 5/09, DUPONT,
CHAMBERS WORKS**

Enclosed is the final data report for the samples collected for the Salem Canal Pore Water Sampling 5/09 at DuPont, Chambers Works. Samples were collected on May 5, 6 and 8, 2009 for the analytical method references summarized in the table below:

Analysis	Method Reference
Volatile Organics, PPL+	SW 846 8260B
Semivolatile Organics, PPL+	SW 846 8270C
Metals, Total	SW 846 6010B
Alkalinity	SM 2320 B
Ammonia	SM 4500-NH3 D
Chloride	EPA 300
Ethane, Ethene, Methane, Propane	SW 846 8015B MOD
Nitrate/Nitrite	EPA 300
Phosphorus	EPA 365.1
Sulfate/Sulfide	EPA 300/SM 4500 S2 D
TOC	SM 5310C

Sample Receipt

Samples were received at Lancaster Laboratories, Lancaster, PA, on May 6-8 and 12, 2009. All samples were received in satisfactory condition and within the EPA temperature guidelines.

Sample Information

Sediment samples were centrifuged at the laboratory to obtain the pore water for analyses. Not all samples yielded enough pore water to analyze all requested parameters. The following table lists the analysis by sample:

SAMPLE DESIGNATION	metals (T)	anions	TOC	alkalinity	PO4	NH3	VOAs	sulfide	SVs	metals (F)
CWK-Z-SCD78(0.0-0.5)	X	X	X	X	X	X	X	X	X

NF = not filled

All volatile data was qualified with a “J” flag due to the centrifugation process.

* Additional cores were collected and held on-site. When the lab indicated insufficient volume was obtained from the original samples submitted, this additional sample volume was sent to the lab.

Data Review

The electronic data submitted for this sampling event was reviewed via the automated DuPont Data Review (DDR) process. One major QC exception was noted during the review. The analysis hold time for acrolein and acrylonitrile was exceeded by a factor of two. The reported non-detects in the associated samples were qualified with an "R" flag.

Several minor QC exceptions were also noted during the review. The MS and/or MSD RPRs for aluminum were above the upper control limit. The reported results in the associated samples may be biased high. The MS and/or MSD RPRs for various compounds were below the lower control limit. The reported results of the affected compounds in the associated samples may be biased low and the reporting limits may be higher than reported.

Analysis hold times for several analyses were exceeded. The reporting limits of the non-detects of the associated samples may be biased low.

Preparation hold times for several analyses were exceeded. The reported results and the reporting limits of the non-detects of the associated samples may be biased low.

Positive results between the method detection limit (MDL) and quantitation limit, not otherwise qualified, were qualified J and should be considered to be estimated values.

Please refer to the DDR Narrative Report for specific data qualification.

The laboratory data reports are included in this report as an attachment. Please do not hesitate to contact me if you have any questions regarding this report.

DuPont In-House Review (DDR)

The DDR is an automated internal review process used by the ADQM group to determine if the data is usable. The data is run through this automated program where a series of checks are performed on the data. The data is evaluated against hold time criteria, checked for blank contamination, assessed against matrix spike(MS)/matrix spike duplicate (MSD) recoveries, assessed against relative percent differences (RPDs) between these samples, assessed against laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries, assessed against RPDs between these samples, assessed against RPDs between laboratory replicates, and assessed against surrogate spike recoveries. The DDR applies the following data qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

Reporting Limit: MDL

DDR Standards LABSTATS

The analysis hold time for this sample was exceeded by a factor of 2. The reported non-detect result is unusable.

Reporting Limit: MDL

DDR Standards LABSTATS

Associated MS and/or MSD analysis had relative percent recovery (RPR) values less than the lower control limit. The actual detection limits may be higher than reported.

**ADQM DATA REVIEW
NARRATIVE**

Site **CWK – Chambers Works**

Project **Salem Canal Peeper Pore Water 10/13**

Project Reviewer **Candia A. Carle**

Sampling Date **October 21 and 22, 2013**

Analytical Protocol

<u>Laboratory</u>	<u>Analytical Method</u>	<u>Parameter(s)</u>
Lancaster	EPA 300.0	Chloride
Lancaster	SW 846 6010B	Iron
Lancaster	EPA 300.0	Nitrate
Lancaster	EPA 300.0	Nitrite
Lancaster	SW 846 8270C	Semivolatile Organics
Lancaster	EPA 300.0	Sulfate
Lancaster	SW 846 8260B	Volatile Organics

Sample Receipt

The following items are noted for this data set:

- All pore water and surface water samples were received in satisfactory condition and within EPA temperature guidelines at Lancaster Laboratories on October 21 and 22, 2013.
- Line outs on the chain of custodies were not both initialed and dated.
- 1,2,4-TCB and TICs were erroneously crossed out by the field team on the chain of custodies for the surface water samples. The lab logged per the project set up and included the 1,2,4-TCB and TICs.

Sample Information

- Due to minimum volumes collected, the semivolatiles from the pore water samples were reported with reduced volume prep. The reporting limits were raised due to this prep. The surface water samples were reported with the standard volume prep.
- Due to the minimum volumes collected, the volatiles and iron were analyzed from one unpreserved 40 mL vial. The volatiles were prescreened, leaving an approximate 750 μ pea-sized bubble, in order to determine the best dilution required, if any. The iron was then analyzed from the remaining volume.
- SCD122-Pore-CL1 was lined off the chain and was not submitted.

Data Review

The electronic data submitted for this project was reviewed via the automated DuPont Data Review (DDR) process. Overall the data is acceptable for use without qualification, except as noted below:

- Some of the analytical results have been qualified in the database. See the DuPont Data Review (DDR) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.
- The LCS/LCSD recoveries for 1,4-naphtoquinone associated with several samples was below the data rejection level. The reported non-detects have been qualified with an R flag. See the DDR Narrative report for affected samples.

Attachments

The DDR Narrative report and laboratory summary level reports are attached.

DuPont In-House Review (DDR)

The DDR is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Validation Module (DVM) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

The DDR applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

Please refer to the laboratory report for a description of the lab qualifiers.

DDR Narrative Report

Site: Chambers Works

Sampling Program: Salem Canal Peeper Porewater 10/13

Validation Options: LABSTATS

Validation Reason Code: Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values below the data rejection level. The reported non-detect result is unusable.

**ADQM DATA REVIEW
NARRATIVE**

Site Chemours CWK – Chambers Works
Project SALEM CANAL PEEPER POREWATER 1/16
Project Reviewer Michael Aucoin
Sampling Date January 12, 2016

Analytical Protocol

<u>Laboratory</u>	<u>Analytical</u>	<u>Parameter(s)</u>
Eurofins Lancaster Labs (Lancaster)	EPA 300.0	Chloride
Lancaster	SW 846 6010B	Iron
Lancaster	EPA 300.0	Nitrate
Lancaster	EPA 300.0	Nitrite
Lancaster	SW 846 8270C	Semivolatile Organics
Lancaster	EPA 300.0	Sulfate
Lancaster	SW 846 8260B	Volatile Organics

Sample Receipt

The following items are noted for this data set:

- All pore water samples were received in satisfactory condition and within EPA temperature guidelines on January 12, 2016.
- All samples were submitted in 40 mL VOA vials consisting of one vial for volatiles and iron, and a second vial for semivolatiles and anions. The vials were unpreserved and unlabeled. The last three digits of the sample IDs (not including the depth in parentheses) were etched onto the sample vials (for example AL1, AL2, AL3, etc) prior to sample collection.

Data Review

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Reporting limits for the semivolatile organics were raised by the laboratory due to limited sample volume available for analysis.
- Additional sample volume for matrix spike quality control (QC) was not available; batch precision and accuracy was provided by laboratory QC samples.

- Non-detect results for 1,4-naphthoquinone are qualified R and considered to be unusable due to very poor relative percent recovery (RPR) values in the associated lab control spike (LCS) and/or lab control spike duplicate (LCSD) analyses.
- Some additional analytical results have been qualified in the database. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

Attachments

The DVM Narrative report and laboratory summary level reports are attached.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

Lab Qualifier is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

DVM Narrative Report

Site: Chambers Works

Sampling Program: SALEM CANAL PEEPER POREWATER 1/16 **Validation Options:** LABSTATS

Validation Reason Code: Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values below the data rejection level. The reported non-detect result is unusable.

**ADQM DATA REVIEW
NARRATIVE**

Site Chemours CWK – Chambers Works
Project SALEM CANAL PEEPER POREWATER 8/16
Project Reviewer Michael Aucoin
Sampling Date August 15 - 16, 2016

Analytical Protocol

<u>Laboratory</u>	<u>Analytical</u>	<u>Parameter(s)</u>
Eurofins Lancaster Labs (Lancaster)	EPA 300.0	Chloride
Lancaster	SW 846 6010B	Iron
Lancaster	EPA 300.0	Nitrate
Lancaster	EPA 300.0	Nitrite
Lancaster	SW 846 8270C	Semivolatile Organics
Lancaster	EPA 300.0	Sulfate
Lancaster	SW 846 8260B	Volatile Organics

Sample Receipt

The following items are noted for this data set:

- All pore water samples were received in satisfactory condition and within EPA temperature guidelines on August 15 and 16, 2016.
- All samples were submitted in 40 mL VOA vials consisting of one vial for volatiles and iron, and a second vial for semivolatiles and anions. The vials were unpreserved and unlabeled. The last three digits of the sample IDs (not including the depth in parentheses) were etched onto the sample vials (for example AL1, AL2, AL3, etc) prior to sample collection.

Data Review

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Reporting limits for the semivolatile organics and for iron were raised by the laboratory due to limited sample volume available for analysis.
- Additional sample volume for matrix spike quality control (QC) was not available; batch precision and accuracy was provided by laboratory QC samples.

- Select semivolatile organic non-detect results are qualified R and considered to be unusable due to very poor relative percent recovery (RPR) values in the associated lab control spike (LCS) and/or lab control spike duplicate (LCSD) analyses.
- Some additional analytical results have been qualified in the database. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

Attachments

The DVM Narrative report is attached. The laboratory summary level reports are stored on a network drive.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

Lab Qualifier is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

DVM Narrative Report

Site: Chambers Works

Sampling Program: SALEM CANAL PEEPER POREWATER 8/16 Validation Options: LABSTATS

Validation Reason Code: Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values below the data rejection level. The reported non-detect result is unusable.

Project SALEM CANAL CHARACTERIZATION AND OUTFALLS 2016

Project Reviewer Michael Aucoin

Sampling Date August 16 - 25, 2016

Analytical Protocol

<u>Laboratory</u>	<u>Analytical Method</u>	<u>Parameter(s)</u>
Eurofins Lancaster Labs (Lancaster)	SW 846 8260B	Volatile Organics
Lancaster	SW 846 8270C	Semivolatile
Lancaster	SW 846 8081A	Pesticides
Lancaster	SW 846 6010B/6020/7470A/7471A	Metals, total
Lancaster	SW 846 9060A MOD.	Total Organic Carbon
Lancaster	ASTM D422	Grain Size
Lancaster	SM 2540 G-1997	Percent Moisture
Alpha Analytical – Mansville (Alpha)	8270D-SIM_680M	PCBs
Alpha	SM 2540 G-1997	Percent Solids
TestAmerica - Denver	SOP DV-LC-0012	PFCs
TestAmerica - Denver	ASTM D2216-90	Percent Moisture

Sample Receipt

The following items are noted for this data set:

- All sediment and blank samples were received in satisfactory condition and within EPA temperature guidelines on August 16 –26, 2016.

Data Review

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Non-detect results for select semivolatile organics, mercury, and TOC in one or more samples are qualified R and considered to be unusable due to very poor relative percent recovery (RPR) values in the associated matrix spike (MS) and/or matrix spike duplicate (MSD) analyses.
- Some additional analytical results have been qualified in the database. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

Attachments

The DVM Narrative report is attached. The laboratory reports are stored on a network drive.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

Lab Qualifier is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

DVM Narrative Report

OUTFALLS 2016

Validation Reason Code: Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values less than the lower control limit but above 10%. The actual detection limits may be higher than reported.

OUTFALLS 2016

Validation Reason Code: Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values less than the lower control limit but above 10%. The actual detection limits may be higher than reported.

Project SALEM CANAL CHARACTERIZATION AND OUTFALLS 2016-SW
Project Reviewer Michael Aucoin
Sampling Date August 15 and 26, 2016

Analytical Protocol

<u>Laboratory</u>	<u>Analytical Method</u>	<u>Parameter(s)</u>
Eurofins Lancaster Labs (Lancaster)	SW 846 8260B	Volatile Organics
Lancaster	SW 846 8270C	Semivolatile Organics
Lancaster	SW 846 8081A	Pesticides
Lancaster	SW 846 6010B/6020/7470A	Metals, total and dissolved
Lancaster	SM 2540 D-1997	Total Suspended Solids
Lancaster	SM 2340 C-1997	Total Hardness As CaCO ₃
Lancaster	SM 5310 C-2000	Dissolved Organic Carbon
Alpha Analytical (Alpha)	8270D-SIM_680M	PCBs
TestAmerica - Denver	SOP DV-LC-0012	PFCs

Sample Receipt

The following items are noted for this data set:

- All surface water and blank samples were received in satisfactory condition and within EPA temperature guidelines on August 15 – 17 and 26 - 27, 2016.

Data Review

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Some analytical results have been qualified in the database. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

Attachments

The DVM Narrative report is attached. The laboratory reports are stored on a network drive.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

Lab Qualifier is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

DVM Narrative Report

Appendix C5

August 2016 Salem Canal Peeper Pore Water Laboratory Data Report

DVM Narrative Report

Site: Chambers Works

Sampling Program: SALEM CANAL PEEPER POREWATER 8/16 Validation Options: LABSTATS

Validation Reason Code: Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values below the data rejection level. The reported non-detect result is unusable.

Acronym List

Acronym	Explanation
AUF	Area use factor
BAZ	Biologically Active Zone
BSAF	Biota-sediment accumulation factor
COPEC	Constituent of Potential Ecological Concern
C _{sediment}	Concentration in sediment
DDX	Dichlorodiphenyltrichloroethane and metabolites
dw	Dry weight
EDD	Estimated daily dose
EPA	U.S. Environmental Protection Agency
EPC	Exposure point concentrations
HMW	High molecular weight
HQ	Hazard quotient
HQ _{High}	Hazard quotient based on high TRV
HQ _{Low}	Hazard quotient based on low TRV
Kg	Kilogram
K _{ow}	Octanol-water partitioning coefficient
mg/kg	Milligrams per Kilogram
NOAEL	No observed adverse effect level
PAH	Polycyclic Aromatic Hydrocarbon
PCB	Polychlorinated Biphenyl
RME	Reasonable maximum exposure
SLERA	Screening-Level Ecological Risk Assessment
SVOC	Semi-Volatile Organic Compound
TOC	Total Organic Carbon
TRV	Toxicity reference value
TRV _{High}	High toxicity reference value
TRV _{Low}	Low toxicity reference value
UCL _{mean}	Upper confidence limit of the mean

USCHPPM	U.S. Army Center for Health Promotion and Preventive Medicine

1.0 Introduction

This appendix describes the approach for estimating dietary exposure to semi-aquatic wildlife in the *Revised Screening Level Ecological Risk Assessment* (Revised SLERA) for the Salem Canal at the Chemours Chambers Works in Deepwater, New Jersey. Adjacent to Chambers Works, the Salem Canal provides limited wildlife habitat due to the lack of riparian vegetation and cover along the developed shoreline of the facility. However, the screening-level problem formulation in the Revised SLERA indicated that semi-aquatic birds and mammals may opportunistically forage within the Salem Canal. Representative species used to evaluate potential exposure to semi-aquatic wildlife receptors include:

- Omnivorous bird: Mallard (*Anas platyrhynchos*)
- Piscivorous bird: Great blue heron (*Ardea herodias*)
- Omnivorous mammal: Raccoon (*Procyon lotor*)

These representative wildlife receptors may be exposed to bioaccumulative constituents of potential ecological concern (COPECs) through the following primary exposure routes:

- Dietary items: Direct ingestion
- Bulk sediment: Incidental ingestion

Wildlife may also be exposed through the direct and incidental ingestion of surface water from the Salem Canal. However, this exposure route provides a negligible contribution to the total receptor dose when compared to the direct ingestion of dietary items and the incidental ingestion of bulk sediment. Therefore, wildlife ingestion of surface water is not an exposure route that will be quantitatively evaluated in the Revised SLERA.

The following sections describe the approach for estimating dietary doses to representative wildlife receptors based on the direct ingestion of COPECs in dietary items, and for select receptors, the incidental ingestion of COPECs in sediment. The following sections present the exposure modeling approach, the selection of wildlife toxicity reference values (TRVs), risk calculations based on dietary doses, and uncertainty in the dietary modeling approach.

2.0 Wildlife Dietary Exposure Modeling

Wildlife ingestion exposure pathways were evaluated for exposure to constituents with the potential to bioaccumulate. Bioaccumulative constituents were defined as organic constituents with log octanol-water partitioning coefficients (K_{ow}) greater than 3.5 (see Revised SLERA Section 4.5.1) and inorganic constituents identified by the U.S. Environmental Protection Agency (EPA) as important bioaccumulative constituents (EPA, 2000).

Deterministic dose rate models were developed to estimate the daily dose (EDD) that semi-aquatic wildlife receptors may receive through foraging activities in the Salem Canal. Wildlife receptors that may be present in the Salem Canal would likely forage over a broad area; therefore, the deterministic models incorporated exposure data collected within the Former Seep Area and the Canal-Wide Area to provide a holistic estimation of the EDD within the Salem Canal.

2.1 Model Structure

The following equation forms the basis for the deterministic exposure estimate for a given receptor (Equation 1):

$$EDD_{total} = \frac{IR_{diet} \times \sum (BSAF_{dw} \times C_{se\ dim\ ent} \times DF_i) \times AUF}{BW} + \frac{IR_{se\ dim\ ent} \times C_{se\ dim\ ent} \times AUF}{BW}$$

where:

- EDD_{total} = Estimated daily dose (mg COPEC/kg BW/day)
- BW = Body weight (kg)
- IR_{diet} = Ingestion rate of food [kg food/day, dry weight (dw)]
- $BSAF_{dw}$ = Biota-sediment accumulation factor (BSAF), specific to prey type and COPEC (mg COPEC/kg sediment, dw)
- $C_{sediment}$ = COPEC concentration in sediment (mg COPEC/kg, dw)
- DF_i = Dietary fraction of item i in total diet (proportion)
- $IR_{sediment}$ = Incidental ingestion rate of sediment (kg/day, dw)
- AUF = Area use factor for exposure area; an AUF of 1.0 is assumed

A general discussion of parameter estimation for the deterministic models is provided below.

2.2 Model Parameters

Receptor-specific exposure factors and exposure variables used in the deterministic models are discussed in the following sections.

2.2.1 Receptor-Specific Exposure Factors

Receptor-specific exposure factors were consistent between the screening-level and refined exposure evaluations for semi-aquatic wildlife. Various literature sources were reviewed to select the receptor-specific exposure factors, including the EPA *Wildlife*

Exposure Factors Handbook (EPA, 1993). Additional receptor-specific literature sources were also used supplement exposure data compiled in EPA (1993). Receptor-specific exposure factors used in the deterministic models are summarized in Table D1; a brief rationale for the selection of receptor-specific exposure factors is provided below:

- Body weight: Receptor body weights were obtained from average body weights reported in literature studies. The average body weight for great blue heron was based on the average body weight in a compilation of exposure parameters by Sample and Suter (1994). Average female body weight in North America was used as the representative body weight for mallard (USCHPPM, 2004). The average of adult female raccoon weights compiled in USCHPMM (2004) was used as the representative body weight for raccoon.
- Dietary composition: The relative composition of prey items in the diets of select wildlife receptors were estimated based on dietary studies obtained from EPA (1993). An exclusive diet of fish was assumed for the piscivorous great blue heron. Raccoon were assumed to obtain a diet consisting of 50 percent fish and 50 percent benthic invertebrates. The dietary composition of the omnivorous mallard duck was conservatively assumed to include exclusively invertebrate tissue, which is typical of the shift that occurs from a largely herbivorous diet in winter to a high protein of mainly animal tissue during spring molt and spring/summer egg production (Swanson and Meyer, 1973; Swanson et al., 1979; Swanson et al., 1985; Heitmeyer, 1988).
- Food ingestion rate: Food ingestion rates were estimated as dry weight intake based on receptor-specific body weight values using appropriate empirical allometric (scaling) relationships developed by Nagy (2001). Allometric equations for each representative receptor are provided in the notes to Table D1.
- Sediment ingestion rate: Receptor-specific sediment ingestion rates were estimated based on the assumed percentage of dry food intake as incidental sediment ingestion and the appropriate allometric relationship for dry food ingestion rates derived by Nagy (2001). Sediment ingestion was estimated at 3.3 and 9.4 percent of mallard and raccoon dry food intake, respectively, based on estimates from Beyer et al. (1994). Sediment ingestion rate for the piscivorous great blue heron was assumed to be negligible based on Sample and Suter (1994).
- Area use factor (AUF): The AUF is an estimate of the proportion of the dose that a receptor may obtain due to foraging activities within the Salem Canal, relative to foraging within the typical home range of the receptor. The AUF is simply the ratio of the size of the study area to the receptor home range or territory size. For the screening-level and refined exposure estimates, an AUF of 1.0 was assumed. Based on this conservative assumption, the model assumes that 100 percent of the receptor dose is obtained by foraging within the Canal-Wide Area and the Former Seep Area.
- Home range: Typical home ranges for representative receptors were obtained based on average home ranges in literature compilations (Sample and Suter, 1994; DeGraaf et al., 1996, EPA, 1993). Because an AUF of 1.0 was assumed for each receptor for screening-level and refined exposure estimates, home ranges are not included in the dose calculations. Home ranges are provided in Table D1 for informational purposes.

2.2.2 Exposure Variables

The screening-level exposure evaluation estimated dietary doses to wildlife based on a reasonable maximum exposure (RME) scenario; the refined exposure evaluation estimated dietary doses based on a conservative measure of average exposure. COPEC concentrations in dietary items were estimated based on biota-sediment accumulation factors (BSAFs) obtained from literature sources (e.g., DiToro and McGrath, 2000, Bechtel, 1998) or the U.S. Army Corps of Engineers (USACE) BASF Database (BASF Database, 2017). The following sections describe the approach used to estimate exposure point concentrations (EPCs) in sediment and dietary items.

Sediment

EPCs for sediment were estimated based on COPEC concentrations in sediment samples collected in the Former Seep Area and the Canal-Wide Area from the biologically active zone (BAZ) of sediment, operationally defined as the 0-0.5-foot sampling interval. Exposure data were limited to the BAZ because this is the depth where the potential for bioaccumulation into dietary items and incidental sediment ingestion occurs.

For the screening-level evaluation, estimates of the dose associated with the incidental ingestion of sediment were based on the maximum detected COPEC concentration as the EPC. Refined exposure models estimated the dose from incidental sediment ingestion based on the upper confidence limit of the mean concentration (UCL_{mean}) of the COPEC.

Dietary Items

Literature-based BASFs were used to estimate the bioaccumulation of COPECs into dietary (e.g., prey) items as a function of sediment concentrations. Tables D2 and D3 present the estimated concentrations of bioaccumulative COPECs in dietary items based on the screening-level and refined exposure estimates, respectively. Sources of BASFs are summarized below by COPEC group:

- Metals: BASFs for metals were estimated based on the preferred models from literature compilations (Bechtel, 1998) and individual studies (e.g., Hirsch, 1998; Song and Breslin, 1999). BASFs for metals are expressed on a dry weight basis ($BASF_{dw}$).
- PAHs: Concentrations of PAHs were estimated based on organic carbon and lipid-normalized BASFs provided in DiToro and McGrath (2000).
- Other organic COPECs: For other organics, including semi-volatile organic compounds (SVOCs), pesticides, and PCBs, organic carbon and lipid normalized BASFs were obtained from the USACE BASF Database. Geometric mean whole body BASFs from freshwater test organisms were selected preferentially from the USACE BASF Database.

Organic carbon and lipid-normalized BASFs were estimated on a dry weight basis using average lipid and organic carbon content in Salem Canal sediments as follows:

$$BASF_{dw} = BASF_{oc} \times f_{lipid} \div f_{oc}$$

where:

- $BSAF_{dw}$ = Biota-sediment accumulation factor (BSAF), specific to prey type and COPEC (kg sediment/kg tissue, dw)
- $BSAF_{oc}$ = Organic carbon and lipid-normalized biota-sediment accumulation factor (BSAF), specific to prey type and COPEC (kg organic carbon/kg lipid)
- f_{lipid} = Fraction of lipid in dietary items (0.065 assumed for benthic invertebrates; 0.08 assumed for fish)
- f_{oc} = Fraction of organic carbon in sediment [0.015 assumed based on minimum average concentration in Reach 1 (1.5 percent); Reach 2 (2.1 percent); Former Seep Area (3.5 percent); Tidal Reach (1.6 percent)].

$BSAF_{dw}$ values for metals and organics were multiplied by the COPEC concentration in sediment ($C_{sediment}$) expressed as mg/kg dw to estimate the COPEC concentration in the dietary item (see Equation 1 in Section 2.1). For the screening-level evaluation, maximum concentrations of COPECs detected in the BAZ were used as $C_{sediment}$ to estimate concentrations in dietary items. In the refined exposure evaluation, $C_{sediment}$ was estimated as the UCL_{mean} concentrations. Tables D2 and D3 present the calculations of COPEC concentrations dietary items for the screening-level and refined exposure evaluations, respectively.

2.3 Toxicity Reference Values

EDDs calculated using Equation 1 in Section 2.1 were compared to conservative TRV_{NOAEL} values to evaluate the potential for adverse effects to wildlife receptors. Consistent with NJDEP (2018), the selection of TRVs to evaluate the potential for adverse effects to wildlife receptors was based on a tiered approach. In the screening-level evaluation, TRVs were selected from first tier TRV sources identified by NJDEP (Table 1 in NJDEP, 2018). In the absence of TRVs from NJDEP (2018), alternate TRVs were primarily obtained from second tier sources including compilations of toxicity data for EPA Ecological Soil Screening Levels [Eco-SSLs; EPA (2005c)] and other sources including EPA (2007b) and Sample et al. (1996). For constituents with EDDs exceeding first tier TRVs in the screening-level exposure evaluation, alternative TRVs were considered in the refined exposure evaluation. Table D4 provides a summary of the screening-level TRVs and Table D5 provides a summary of refined TRVs selected to evaluate estimated doses to representative semi-aquatic wildlife receptors identified in the Salem Canal.

2.4 Fish Ingestion Pathway Evaluation

To address EPA comments on the April 2017 Revised SLERA regarding potential dietary exposure to demersal fish, a literature review was conducted to identify toxicological endpoints to support a quantitative assessment of dietary ingestion pathways to fish. The EPA ECOTOXicology Database (ECOTOX) was queried for survival, growth, or reproductive endpoints for fish based on dietary exposure to bioaccumulative COPECs. Consistent with the wildlife ingestion pathway evaluation presented above, bioaccumulative constituents were defined as detected organic constituents with $\log K_{ow}$ values greater than 3.5 and detected inorganic constituents identified by EPA as important bioaccumulative constituents (EPA, 2000). Selected

studies were based on juvenile and adult life stages that would potentially forage on benthic invertebrates in sediment within the Salem Canal. Geometric mean concentrations for NOEC and LOEC endpoints for survival, growth, or reproductive endpoints were calculated for comparison with estimated concentrations in dietary items in the Salem Canal. A summary of the selected ECOTOX studies is presented in Table D6.

Estimated dietary concentrations in sediment-associated prey in the Salem Canal were directly compared to geometric mean dietary endpoints calculated from ECOTOX studies. For screening-level exposure evaluations, maximum concentrations estimated in benthic invertebrate prey items (see Section 2.2.2) were compared to dietary NOEC and LOEC endpoints for survival, growth, and reproduction in fish.

2.5 Risk Characterization

The following sections present the approach for evaluating the potential for adverse effects to semi-aquatic wildlife receptors in the Salem Canal based on EDDs calculated using the deterministic models described in Section 2.0.

2.5.1 Risk Calculation

Potential risks associated with dietary exposure to wildlife were expressed as hazard quotients (HQs), which represent the ratio of the EDD to the TRV:

$$HQ = \frac{EDD}{TRV}$$

HQs are calculated for low TRVs (HQ_{Low}) and high TRVs (HQ_{High}) for each EDD. Potential risk may be characterized based on HQs, as follows:

- HQ_{Low} less than 1.0 indicates limited potential for adverse effects because the estimated EDD is below the minimum NOAEL TRV identified in the literature; the potential for adverse effects is negligible.
- HQ_{Low} greater than 1.0 and HQ_{High} less than 1.0 indicate that the EDD exceeds a conservative NOAEL TRV, but is within the range of NOAEL TRVs identified in the literature; the potential for adverse population-level effects is minimal.
- HQ_{High} greater than 1.0 indicates that the EDD exceeds a NOAEL TRV and the potential for adverse effects cannot be dismissed; further evaluation of dietary exposure may be warranted.

2.5.2 Risk Characterization

Based on the modeling approach presented in the previous sections, exposure estimates for ingestion pathways were calculated for representative wildlife receptors that may opportunistically forage in the Salem Canal. The following sections present the exposure estimates and risk characterizations for wildlife based on screening-level and refined exposure assumptions.

Screening-Level Exposure Evaluation

Screening-level exposure estimates for mallard, great blue heron, and raccoon are presented in Tables D7, D8, and D9, respectively. The results of the screening-level evaluation indicate limited potential for adverse effects to semi-aquatic wildlife exposed to COPECs through ingestion pathways based on maximum exposure assumptions.

HQs for modeled doses to mallard, great blue heron, and raccoon for any constituents with estimated doses exceeding TRVs are summarized below:

COPEC	Mallard		Great Blue Heron		Raccoon	
	HQ _{NOAEL}	HQ _{LOAEL}	HQ _{NOAEL}	HQ _{LOAEL}	HQ _{NOAEL}	HQ _{LOAEL}
Chromium	13.7	2.3	<1	<1	5.2	<1
Copper	3.2	1.6	<1	<1	<1	<1
Lead	31.7	3.2	25.9	2.6	7.4	<1
Mercury	16.4	8.2	12.6	6.3	6.2	3.7
Total LMW PAHs	1.5	<1	2.2	<1	<1	<1
Total HMW PAHs	60.4	6.0	90.3	9.0	2.9	<1
Total DDx	1.6	<1	2.5	<1	<1	<1

Based on maximum EPCs, estimated doses of chromium, copper, lead, mercury, total low molecular weight (LMW) PAHs, total high molecular weight (HMW) PAHs, and total DDx exceeded TRV_{NOAEL} values for at least one receptor. Estimated doses of each COPEC, except total LMW PAHs and total DDx, exceeded TRV_{LOAEL} values for at least one receptor based on maximum exposure assumptions.

Refined Exposure Evaluation

Refined exposure estimates for semi-aquatic wildlife calculated using UCL_{mean} sediment concentrations as EPCs indicate minimal potential for adverse effects to representative receptors that may forage throughout the Salem Canal. Refined exposure estimates for mallard, great blue heron, and raccoon are presented in Tables D10, D11, and D12, respectively.

HQs for modeled doses to mallard, great blue heron, or raccoon for COPECs with estimated doses exceeding TRV_{low} or TRV_{high} are summarized below.

COPEC	Mallard		Great Blue Heron		Raccoon	
	HQ _{NOAEL}	HQ _{LOAEL}	HQ _{NOAEL}	HQ _{LOAEL}	HQ _{NOAEL}	HQ _{LOAEL}
Chromium	2.7	<1	<1	<1	1.0	<1
Lead	<1	<1	<1	<1	<1	<1
Mercury	<1	<1	<1	<1	<1	<1
Total LMW PAHs	<1	<1	<1	<1	<1	<1
Total HMW PAHs	<1	<1	<1	<1	<1	<1

The results of the refined exposure evaluation indicate minimal potential for adverse effects to mallard exposed to chromium through ingestion pathways. The estimated daily dose of chromium to mallard based on the UCL_{mean} sediment concentration for the Canal-Wide Area resulted in an HQ_{NOAEL} of 2.7; the estimated daily dose of chromium to mallard was lower than the LOAEL-based TRV ($HQ_{LOAEL} < 1$). The estimated daily dose of chromium to raccoon was equivalent to the NOAEL TRV, but lower than the LOAEL TRV. The estimated daily dose of chromium to great blue heron was below the TRV_{NOAEL} and TRV_{LOAEL} values based on the refined EPC. Refined doses of total HMW PAHs were below TRV_{NOAEL} values for each receptor. Refined exposure estimates for wildlife are considered to be conservative based on the assumption that receptors would forage entirely within the Canal-Wide Study Area.

No further refinement of potential wildlife exposure to total DDX was conducted due to the limited number of detections of DDX compounds. However, the limited detection frequency and relatively low concentrations of DDX compounds indicate that adverse effects to wildlife are not likely. As discussed in Section 6.2.2, estimated daily doses of total DDX slightly exceeded the TRV_{NOAEL} value for mallard and great blue heron, resulting in HQs of 1.6 and 2.5, respectively. Estimated total DDX doses did not exceed TRV_{LOAEL} values for either receptor in the screening-level evaluation. Refinement of the screening-level evaluation for total DDX using refined EPCs was not possible due to three or fewer samples containing detected concentrations of DDX compounds (see Table 38), which precluded the calculation of refined UCL_{mean} concentrations. Given the limited exceedances of TRV_{NOAEL} values based on the maximum exposure scenario presented in the screening-level exposure evaluation and the low detection frequencies of DDX compounds in the BAZ, adverse effects to wildlife are not likely.

Risk Summary

The results of the refined exposure evaluation presented in the previous sections indicate negligible risk to semi-aquatic wildlife that may potentially forage throughout the Salem Canal. Deterministic dose rate models for semi-aquatic wildlife foraging exclusively at EPCs based on UCL_{mean} concentrations resulted in minimal exceedances of the conservative TRV_{low} and no exceedances of the TRV_{high} . The estimated daily doses calculated by the models likely overestimate exposure given that receptors are not likely to forage exclusively in the Salem Canal due to the poor-quality habitat available along the developed riparian adjacent to Chambers Works. Based on these findings, no further evaluation of wildlife exposure in the Salem Canal is warranted.

3.0 Fish Ingestion Pathway Evaluation

To address EPA comments on the April 2017 Revised SLERA regarding potential dietary exposure to demersal fish, a literature review was conducted to identify toxicological endpoints to support a quantitative assessment of dietary ingestion pathways to fish.

3.1 Assessment Approach

The EPA ECOTOXicology Database (ECOTOX) was queried for survival, growth, or reproductive endpoints for fish based on dietary exposure to bioaccumulative COPECs. Consistent with the wildlife ingestion pathway evaluation presented above, bioaccumulative constituents were defined as detected organic constituents with log K_{ow} values greater than 3.5 and detected inorganic constituents identified by EPA as important bioaccumulative constituents (EPA, 2000). Selected studies were based on juvenile and adult life stages that would potentially forage on benthic invertebrates in sediment within the Salem Canal. Geometric mean concentrations for NOEC and LOEC endpoints for survival, growth, or reproductive endpoints were calculated for comparison with estimated concentrations in dietary items in the Salem Canal. A summary of the selected ECOTOX studies is presented in Table D6.

3.2 Risk Characterization

Estimated dietary concentrations in sediment-associated prey in the Salem Canal were directly compared to geometric mean dietary endpoints calculated from ECOTOX studies. For screening-level exposure evaluations, maximum concentrations estimated in benthic invertebrate prey items (see Section 2.2.2) were compared to dietary NOEC and LOEC endpoints for survival, growth, and reproduction in fish. Maximum estimated concentrations of cadmium, mercury, zinc, total DDX and total PCBs exceeded NOEC benchmarks for dietary concentrations for fish that could be derived based on ECOTOX data (Table D13). Maximum estimated dietary concentrations of cadmium and total PCBs exceeded LOEC benchmarks for growth endpoints.

The refined evaluation of dietary exposure to fish was based on comparisons of estimated concentrations in benthic invertebrates based on UCL_{mean} sediment concentrations to dietary endpoints for fish survival, growth, and reproduction. Refined estimates of cadmium, mercury, and total PCBs concentrations in benthic invertebrates were below available dietary NOECs for fish survival, growth, and reproduction (Table D14). The estimated concentration of zinc in benthic invertebrates exceeded NOECs for growth and survival, resulting in a maximum $HQ_{NOEC} = 1.6$; however, the estimated zinc concentration was substantially below the LOEC for growth. Refined benthic invertebrate EPCs for cadmium and total PCBs exceeded available dietary LOECs for growth; however, the refined EPCs were below growth NOECs. A refined EPC could not be calculated for total DDX, due the low number of detected concentrations of DDT and its metabolites in sediment.

4.0 Uncertainty Analysis

There is inherent uncertainty in estimating potential exposure to wildlife using the deterministic dietary models described in this appendix. Unlike probabilistic exposure modeling, deterministic models do not account for the variability in the selection of receptor-specific exposure factors or exposure variables. To minimize the uncertainty in selecting static exposure parameters and exposure variables, the models were parameterized with conservative exposure assumptions intended to minimize the probability of underestimating exposure to wildlife via ingestion pathways. Key uncertainties associated with model parameters that may overestimate, underestimate, or have an unknown effect on the estimation of exposure to wildlife receptors are summarized below:

- Exposure factors: Exposure factors selected for the model are intended to be representative of typical populations of wildlife receptors. Estimated rates of food and incidental sediment ingestion were based on standard sources of exposure parameters to provide representative estimates of typical intake. However, these parameters may not be representative of the exposure conditions and receptors that may forage within the Salem Canal.
- BSAFs: Bioaccumulation of COPECs from sediment to receptors is site- and receptor-specific. Therefore, the use of literature-derived BSAFs may not accurately reflect the bioaccumulation of COPECs from sediment in the Salem Canal. Conservative assumptions regarding sediment TOC (e.g., minimum average values) were used to minimize the potential for the BSAF to underestimate risk.
- Exposure point concentrations: EPCs were intended to minimize the underestimation of exposure conditions in the deterministic model. In the screening-level evaluation, the EPC was based on the maximum detect concentration, which represents the worst-case exposure scenario. The refined exposure evaluation was intended to provide a more representative scenario of receptors that may be exposed to average EPCs by foraging randomly throughout the Salem Canal. The UCL_{mean} was used as a conservative estimate of the mean for the refined exposure evaluation to minimize the potential of underestimating the EDD.
- Area use factor: Deterministic models conservatively estimated doses based on receptors that forage 100 percent of the time within the Salem Canal. As previously discussed, limited habitat within the riparian zone of the Salem Canal adjacent to Chambers Works likely limits wildlife use to opportunistic wildlife. Therefore, the assumption of 100 percent area use likely overestimates wildlife exposure in the Salem Canal, particularly in the screening-level exposure evaluation, which assumes that receptors forage 100 percent of the time, to the maximum COPEC concentration detected in the Canal-Wide Area and Former Seep Area.
- Seasonal variability: Seasonal differences in dietary composition or foraging behavior are not accounted for in the estimation of EDD. Seasonal variability in dietary preferences may result in lower or higher exposures. To minimize the effect of this uncertainty on risk calculations, more conservative exposure factors were used in the calculation of EDDs. For example, the dietary preference of

mallard duck was assumed to be based on 100 percent consumption of benthic invertebrates to conservatively higher protein requirements during spring molt and spring/summer egg production (see Section 2.2.2).

Given the conservative parameters included in the deterministic exposure models, it is not likely that dietary exposures to wildlife were underestimated in the Revised SLERA.

Table D1
Summary of Exposure Parameters for Wildlife Receptors of Concern
Revised Salem Canal Screening-Level Ecological Risk Assessment
Chemours Chambers Works, Deepwater, New Jersey

Representative Species			Home Range ^a	Home Range Reference	Area Use Factor (AUF)	Body Weight (kg wet weight)	Dietary Composition				References	Ingestion Rates				
							Plant Material	Invertebrates	Fish	Small Mammals		Food		Substrate		
Common Name	Scientific Name	Food-web classification									kg dry weight/day	Reference	% of Dry Intake	kg dry wt./day	Reference	
Avian Receptors																
Great blue heron	<i>Ardea herodias</i>	medium piscivore	7 - 8 km	Sample and Suter (1994)	1.0	2.39			100%		USEPA (1993)	0.147	Nagy (2001) ^b	0%	0	Sample and Suter (1994) ^f
Mallard	<i>Anus platyrhynchos</i>	aquatic omnivore	283 ha	DeGraaf et al. (1986)	1.0	1.04		100%			USEPA (1993)	0.052	Nagy (2001) ^c	3.3%	0.0017	Beyer et al. (1994)
Mammalian Receptors																
Raccoon	<i>Procyon lotor</i>	medium semi-aquatic omnivore	108 ha	USEPA (1993)	1.0	5.3		50%	50%		USEPA (1993)	0.145	Nagy (2001) ^e	9.4%	0.014	Beyer et al. (1994)

Notes:
a, km, kilometers; ha, hectares;
b, Estimated food ingestion rate (kg/day dry weight) for carnivorous birds = $(0.849[\text{Body Weight in grams}]^{0.663})/1000$ (Nagy 2001);
c, Estimated food ingestion rate (kg/day dry weight) for omnivorous birds = $(0.670[\text{Body Weight in grams}]^{0.627})/1000$ (Nagy 2001);
d, Estimated food ingestion rate (kg/day dry weight) for Carnivora = $(0.102[\text{Body Weight in grams}]^{0.864})/1000$ (Nagy 2001);
e, Estimated food ingestion rate (kg/day dry weight) for omnivorous mammals = $(0.432[\text{Body Weight in grams}]^{0.678})/1000$ (Nagy 2001);
f, Based on assumption from Sample and Suter 1994 that substrate ingestion is negligible for piscivores;

Notes:

- NA, Normalized BSAF was not applicable for metals or not available for 2,4-dinitrotoluene
- a. Normalized BSAF (kg OC / kg lipid) calculated based on K_{ow}, where BSAF = K_{ow}^{0.008} (DiToro and McGrath 2000)
- b. For organic constituents, Site-wide BSAF calculated from sediment organic carbon and lipid normalized BSAF as follows:

$$BSAF_{Site-wide} = BSAF_{norm} \times f_{lipid} \div f_{oc}$$

where: alized BSAF (kg OC/kg lipid)

on of lipids in prey item expressed on a dry weight basis (0.065, invertebrates; 0.08, fish)
 fraction of sediment organic carbon expressed on a dry weight basis (0.028 or 2.8%)

- c. Median BSAF for non-depurated invertebrates determined by Bechtel (1998)
- d. 90th percentile BSAF for depurated invertebrates determined by Bechtel (1998)
- e. 90th percentile BSAF for non-depurated invertebrates determined by Bechtel (1998)
- f. Invertebrate concentrations (mg/kg dry weight) calculated based on regression models, where slopes (B1) and intercepts (B0) are as follows:

Metal	Model	B0	B1	Data Source for Model
Selenium	γ = B1 ¹ sediment	--	1.422	Hamilton and Buhl (2003a and 2003b)

- g. Mean BSAF calculated from Song and Breslin (1999)
- h. Sediment-to-fish BSAFs could not be identified; therefore, concentrations in fish were assumed to be equal to concentrations in benthic invertebrates.
- k. Organic constituents with log K_{ow} less than 3.5 are not considered bioaccumulative constituents (USEPA 2000); bioaccumulation factor of 1.0 conservatively assumed.

Notes:

a, Dietary dose calculated as:

$$ADD_{diet} = \frac{IR_{diet} \times \sum (B[S]AF \times C_{substrate} \times DF_i)}{BW} \times AUF$$

b, Substrate dose calculated as:

$$ADD_{substrate} = \frac{IR_{substrate} \times C_{substrate} \times AUF}{BW}$$

c, Total dose calculated as:

$$ADD_{total} = ADD_{diet} + ADD_{water} + ADD_{substrate}$$

NA, TRV was not available.

--, HQ could not be calculated because TRV was not available.

- ADD_{diet} = Dose of COPEC obtained from the diet (mg COPEC/kg receptor body weight)
- IR_{diet} = Ingestion rate of food (kg food ingested per day, dry weight)
- B(S)AF = Bioaccumulation factor (BAF) or biota-sediment accumulation factor (BSAF) specific to prey type and COPEC (kg substrate/kg food, dry weight)
- C_{substrate} = COPEC concentration in substrate (mg COPEC/kg substrate, dry weight)
- DF_i = Dietary fraction of food item i (proportion of food type in the diet)
- AUF = Area use factor includes seasonal use rates, area use rates, COPEC ass
- BW = Body weight of the receptor, wet weight (kg)
- ADD_{substrate} = Dose of COPEC from incidental substrate ingestion (mg COPEC/kg body weight)
- IR_s = Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)
- C_{substrate} = COPEC concentration in substrate (mg COPEC/kg substrate, dry weight)

Notes:

a. Dietary dose calculated as:

$$ADD_{diet} = \frac{IR_{diet} \times \sum (B[S]AF \times C_{substrate} \times DF_i) \times AUF}{BW}$$

b. Substrate dose calculated as:

$$ADD_{substrate} = \frac{IR_{substrate} \times C_{substrate} \times AUF}{BW}$$

c. Total dose calculated as:

$$ADD_{total} = ADD_{diet} + ADD_{water} + ADD_{substrate}$$

NA, TRV was not available.

--, HQ could not be calculated because TRV was not available.

- ADD_{diet} = Dose of COPEC obtained from the diet (mg COPEC/kg receptor body weight)
- IR_{diet} = Ingestion rate of food (kg food ingested per day, dry weight)
- B(S)AF = Bioaccumulation factor (BAF) or biota-sediment accumulation factor (BSAF) specific to prey type and COPEC (kg substrate/kg food, dry weight)
- C_{substrate} = COPEC concentration in substrate (mg COPEC/kg substrate, dry weight)
- DF_i = Dietary fraction of food item i (proportion of food type in the diet)
- AUF = Area use factor includes seasonal use rates, area use rates, COPEC assis
- BW = Body weight of the receptor, wet weight (kg)
- ADD_{substrate} = Dose of COPEC from incidental substrate ingestion (mg COPEC/kg body weight)
- IR_s = Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)
- C_{substrate} = COPEC concentration in substrate (mg COPEC/kg substrate, dry weight)

Table D9
Screening-Level Exposure Evaluation - Raccoon
Revised Salem Canal Screening-Level Ecological Risk Assessment
Chemours Chambers Works, Deepwater, New Jersey

Analyte	Exposure Point Concentration	Raccoon Dose (mg/kg bw-day)								
		Diet			Substrate	Total Dose ^c	TRV _{Low}	HQ _{Low}	TRV _{High}	HQ _{High}
	Invertebrates	Fish	Dose _{diet}	Dose _{substrate}						
	Maximum Sediment Concentration (mg/kg, dw)

1.0 Introduction

This appendix describes the approach for deriving sediment quality benchmarks (SQBs) for use in the evaluation of exposure to bulk sediment in the Revised Screening Level Ecological Risk Assessment (SLERA) for the Salem Canal at the Chemours Chambers Works Complex in Deepwater, New Jersey. SQBs were derived for select organic constituents lacking an ecological screening value (ESV) in the screening-level exposure evaluation and for select organic constituents of potential ecological concern (COPECs) warranting further assessment in the refined exposure evaluation. SQBs were developed for COPECs in bulk sediment using the following approaches:

- An equilibrium partitioning (EqP) approach consistent with U.S. Environmental Protection Agency (EPA, 2008) to develop representative SQBs for varying organic carbon content in site reaches.
- EqP Sediment Benchmark (ESB) approach for evaluating polycyclic aromatic hydrocarbon (PAH) mixtures in sediment (EPA, 2003a).
- Organic-carbon normalization of SQBs derived in EPA guidance documents (EPA, 2003a; EPA, 2003b; EPA, 2003c; EPA, 2004; and EPA, 2008).

The following sections identify the COPECs selected for the derivation of SQBs and describe the calculation procedures, including assumptions regarding input parameters in the SQB calculations.

2.0 Derivation of Sediment Quality Benchmarks

SQB values were derived for nonionic organic COPECs with maximum concentrations exceeding conservative ESVs in the screening-level exposure evaluation and select organic constituents lacking ESVs. A summary of ESBs derived in this appendix and the associated chemical characteristics, toxicological basis, and aqueous toxicity endpoints are presented in Table E1. The following sections describe each approach for calculating ESBs for the organic COPECs identified in Table E1.

2.1 Equilibrium Partitioning (EqP) Approach for Nonionic Organic Constituents

SQB values represent concentrations of organic constituents in bulk sediment that, at equilibrium, would result in partitioning to sediment porewater at concentrations equivalent to no observed effect concentration (NOEC) water quality benchmarks (WQB_{NOEC}) based on constituent-specific organic carbon-water partitioning coefficients (K_{oc}) based on the following relationship:

$$SQB_{NOEC} = (f_{oc} \times K_{oc} \times WQB_{NOEC})$$

where:

SQB_{NOEC} = Sediment quality benchmark based on NOEC aqueous toxicity data ($\mu\text{g}/\text{kg}$ dry weight sediment)

K_{oc} = Organic carbon-water partitioning coefficient (L/kg);

WQB_{NOEC} = Water quality benchmark based on a chronic NOEC ($\mu\text{g}/\text{L}$)

SQB values were calculated based on WQB_{NOEC} values based on the following categories of sediment organic carbon content:

- Former Seep Area: Average total organic carbon (TOC) concentration of 3.5 percent.
- Canal-Wide Area: Average TOC concentration of 1.5 percent, which represents the lowest average TOC concentration measured in Reach 1 (1.5 percent), Reach 2 (2.1 percent), and the Tidal Reach (1.6 percent).

An additional category of SQBs normalized to 1 percent TOC is also provided for comparison with other sources of sediment benchmarks.

Constituent-specific K_{ow} and K_{oc} values were used to develop the SQB_{dw} . Conservative values were obtained from data published in technical papers prepared by the EPA and the chemical profiles published by the Agency for Toxic Substances and Disease Registry (ATSDR). If K_{oc} values were not identified in published sources, constituent-specific K_{oc} values were calculated as a function of K_{ow} . Constituent-specific values for K_{ow} were obtained from EPA Estimation Programs Interface (EPI) Suite database, with preference given to experimental values of K_{ow} before estimated values. K_{oc} values were estimated based on constituent-specific K_{ow} values based on the following relationship (EPA, 2008; Di Toro et al, 1991):

$$\log K_{oc} = 0.0028 + 0.983 \times (\log K_{ow})$$

where:

$\log K_{oc}$ = log organic carbon-normalized sediment quality benchmark (L/kg); and

$\log K_{ow}$ = log octanol-water partition coefficient (unitless).

For weakly hydrophobic organic constituents, defined as organic constituents with $\log K_{oc}$ values less than 2.0, the contribution of the dissolved phase was accounted for in the EqP model using the modification proposed by Fuchsman (2003):

$$SQB_{NOEC} = WQB_{NOEC} \times \left[(f_{oc} \times K_{oc}) + \frac{1 - f_{solids}}{f_{solids}} \right]$$

where: f_{solids} is the proportion of sediment as solids. An f_{solids} value of 0.7 was assumed for sediments in the Salem Canal based on the arithmetic mean value of site sediment moisture content of 30 percent [$1 - 0.3 = 0.7$; DuPont Corporate Remediation Group (CRG), 2005].

2.1.1 Water Quality Benchmarks

Chronic WQB_{NOEC} values were derived based on conventional water quality criteria or narcosis theory, depending on the constituent-specific mode of toxicity (EPA, 2008). The toxicological basis for the selection of WQB_{NOEC} values for constituents with derived SQBs is summarized in Table E1. The following sections present the approach for deriving Chronic WQB_{NOEC} values based on conventional and narcotic toxicity.

Narcotic Toxicity

Chronic WQB_{NOEC} values for nonionic organic constituents with narcotic mode of toxicity were derived using the approach presented by DiToro et al. (2000). The method provides the basis for the development of chronic WQB_{NOEC} values for type 1 narcotic chemicals based on the analysis of a database of the lethal concentrations to 50 percent of organisms (LC_{50}) comprising 156 chemical and 33 test organisms, including fish, amphibians, arthropods, mollusks, polychaetes, coelenterates, and protozoans (DiToro et al., 2000). A target lipid model (TLM) is proposed that accounts for differences in species sensitivities and constituent differences. Based on the TLM, aqueous LC_{50} values can be estimated based on the critical body burden related to 50 percent narcotic mortality and a constituent-specific target lipid-water partitioning coefficient, which is a function of constituent-specific K_{ow} . Final chronic values (FCVs) are estimated from the 5th percentile of acute LC_{50} genus mean acute values (GMAVs) using an acute-to-chronic ratio; the resulting FCVs are considered to represent a 95th percentile level of protection. Based on these relationships, DiToro et al. (2000) derives FCV values for narcotic constituents as follows:

$$\log(FCV) = \log[C_L^*(5\%, baseline) \times \Delta C_l / ACR] - 0.945 \times \log(K_{ow})$$

Where:

- | | |
|------------------------|---|
| $\log(FCV)$ | = log final chronic value (millimole per liter [mmol/L]). |
| $C_L^*(5\%, baseline)$ | = Critical body burden estimated as the 5 th percentile concentration from ranked ordered GMAVs. Estimated as 35.3 micromole per gram ($\mu\text{mol/g}$) octanol in DiToro et al. (2000). |
| ΔC_l | = Chemical class correction to account for toxicity differences between chemical groups. A chemical class correction of -0.244 was applied to halogenated chemicals per DiToro et |

	al. (2000); no other chemical class corrections were applicable.
ACR	= Acute-to-chronic ratio. Estimated as 5.09 ± 0.95 in DiToro et al. (2000).
log K_{ow}	= log octanol-water partition coefficient (unitless).

FCVs calculated based on the approach presented above for narcotic constituents are summarized in Table E1. FCVs were applied in EqP models as chronic WQB_{NOEC} values as the basis for calculating SQBs for narcotic COPECs.

The SQB for chlorobenzene used in previous assessments of benthic invertebrate exposure within the Former Seep Area was calculated using an EqP approach based on a chronic WQB derived from a theoretical quantitative structure-activity relationship (QSAR; see DuPont CRG, 2005; Hermens et al. 1984). Assuming an average TOC concentration of 3.5 percent in the Former Seep Area, the QSAR-based SQB for chlorobenzene was 23 mg/kg (dry weight). EPA (2008) calculated an organic carbon-normalized SQB for chlorobenzene of 570 mg/kg organic carbon based on the narcosis mode of toxic action, which is equivalent to 20 mg/kg at a TOC concentration of 3.5 percent. Given that the EPA (2008) benchmark is based on narcosis theory, as opposed to a theoretical QSAR endpoint, the EPA (2008) benchmark is used as the refined SQB in the Revised SLERA.

Conventional Toxicity

For constituents with conventional modes of chronic toxicity values, WQB_{NOEC} values were selected from sources of aqueous screening criteria. Sources of available conventional chronic toxicity data for these constituents are briefly discussed below and are summarized in Table E1.

When available, conventional water quality values from federal, state, or regional compilations of surface water benchmarks were used as the basis of WQB_{NOEC} values. If available, conventional WQBs compiled in EPA (2008) for the derivation of SQBs were used preferentially in the section of WQB_{NOEC} values for SQB calculations. If conventional WQBs were not available in EPA (2008), additional compilations of surface water quality screening criteria were consulted, including:

- NJDEP freshwater chronic ecological screening criteria (FW2 Chronic ESC; NJDEP, 2009)
- Texas Commission on Environmental Quality (TCEQ, 2017)
- Michigan Department of Environmental Quality (MDEQ, 2014)
- Chronic National Recommended Water Quality Criteria (NRWQC)
- EPA Region 3 Biological Technical Assistance Group (BTAG)
- EPA Region 5 ecological screening levels (ESLs)
- EPA Region 6 Surface Water Benchmarks
- Oak Ridge National Laboratory (ORNL) Toxicological Benchmarks for Screening Potential Contaminants of Concern for Effects on Aquatic Biota: 1996 Revision (Suter and Tsao, 1996).

In the absence of chronic WQBs, studies from peer-reviewed literature, EPA ECOTOXicology database (ECOTOX), and Ecological Structure Activity Relationships

(ECOSAR) were reviewed as additional sources of WQB_{NOEC} values. Aqueous toxicity data for benthic invertebrate test organisms were selected preferentially over toxicity data based on other aquatic test organisms. For nitrobenzene, a 21-day NOEC for daphnid reproduction reported by Kuhn et al. (1989) was used as a chronic WQB_{NOEC} for SQB calculations. For 4-chloroaniline, an acute LC_{50} concentration for midges reported by Julin and Sanders (1978) was identified as an acute WQB ; a chronic WQB_{NOEC} for 4-chloroaniline was estimated from the acute LC_{50} using an acute-to-chronic ratio (ACR) of 8.1 based on 48-hour LC_{50} data reported for aniline by Sloof et al. (1983) and 21-day NOEC data by Gersich and Milazzo (1990), respectively.

Where chemical-specific toxicity data were not available, a quantitative structure-activity relationship (QSAR) was used. Chronic values for exposure to daphnid test organisms (Daphnid ChV) were estimated based on QSAR using the EPA Ecological Structure Activity Relationships (ECOSAR) module in the EPA Estimation Programs Interface (EPI) Suite software program (Table E1). However, if available, measured data were preferentially selected over QSAR-estimated values.

2.2 Equilibrium Partitioning Sediment Benchmarks for PAH Mixtures

The evaluation of benthic invertebrate exposure to PAHs was refined using EPA *Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks for the Protection of Benthic Organisms: PAH Mixtures* (EPA, 2003a). The sum of Equilibrium Partitioning Sediment Benchmark Toxic Units ($\sum ESBTUs$) were calculated for each sample to reflect the additive toxicity of PAH mixtures as follows:

$$\sum ESBTU_{FCV,Total} = \sum_{i=1}^{13} \frac{C_{oc,PAHi}}{C_{oc,PAHi,FCVi}} \times UF$$

where:

$\sum ESBTU_{FCV,Total}$	= Sum of ESBTUs for the PAH mixture (unitless)
C_{ocPAHi}	= Organic carbon normalized concentration of PAH i ($\mu\text{g}/\text{g}_{oc}$)
$C_{ocPAHi,FCVi}$	= Organic carbon normalized critical concentration of PAH i based on the final chronic value ($\mu\text{g}/\text{g}_{oc}$)
UF	= Uncertainty factor to estimate the toxicity of total PAHs (based on 34 PAHs – 18 parent and 16 alkylated compounds) using measurements of 13 PAHs in bulk sediment in the Salem Canal.

$\sum ESBTU_{FCV,Total}$ values for PAH mixtures were calculated based on concentrations of 13 PAHs and TOC measured in each sample. The $\sum ESBTU_{FCV,Total}$ was developed based on the analysis of 34 PAHs (EPA, 2003). To account for the potential toxicity of unmeasured PAHs between the analyses of 13 PAHs in the Salem Canal and the $\sum ESBTU_{FCV,Total}$ model based on 34 PAHs, a conservative uncertainty factor (UF) was applied in the calculation. A UF of 6.78 was applied to the estimation of the summed toxic units based on the analysis of 13 PAHs ($\sum ESBTU_{FCV,13}$) to estimate $\sum ESBTU_{FCV,Total}$. This UF corresponds to the 80th percentile of the distribution of $\sum ESBTU_{FCV,Total}/\sum ESBTU_{FCV,13}$ evaluated in EPA (2003a). $\sum ESBTU_{FCV,Total}$ values less than 1 are considered to be protective of benthic invertebrate communities.

Calculations of $\sum \text{ESBTU}_{FCV,Total}$ values for PAH mixtures in samples collected from the Former Seep Area are presented in Table E2; calculations of $\sum \text{ESBTU}_{FCV,Total}$ values for PAH mixtures in samples collected from the Canal-Wide Area are provided in Table E3.

2.3 Organic Carbon Normalization Approach

SQB_s for select volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and pesticides were calculated from ESB_s derived in EPA guidance documents using an EqP approach:

- EPA (2008): *Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks for the Protection of Benthic Organisms: Compendium of Tier 2 Values for Nonionic Organics*.
- EPA (2004): *The incidence and severity of sediment contamination in surface waters of the United States. National sediment quality survey*.
- EPA (2003b): *Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks for the Protection of Benthic Organisms: Dieldrin*.
- EPA (2003c): *Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks for the Protection of Benthic Organisms: Endrin*.

ESB_s were expressed in the guidance documents on an organic carbon-normalized basis [$\mu\text{g}/\text{kg}$ organic carbon (oc)]. These organic carbon-normalized ESB_s were adjusted to dry weight sediment concentrations for use as NOEC SQB_s using average site-specific TOC concentrations (see Section 2.1) based on the following relationship:

$$SQB_{NOEC} = ESB \times f_{oc}$$

where:

- SQB_{NOEC} = No observed effect concentration sediment quality benchmark ($\mu\text{g}/\text{kg}$ dry weight)
- ESB = Equilibrium partitioning sediment benchmark (ESB) ($\mu\text{g}/\text{kg}$ oc)
- f_{oc} = Fraction of organic carbon (Former Seep Area: 0.035; Canal-Wide Area: 0.015; see Section 2.1)

A summary of the ESB_s ($\mu\text{g}/\text{kg}$ oc) from the primary EPA source documents and adjusted dry weight NOEC SQB_s ($\mu\text{g}/\text{kg}$ dw) based on exposure area-specific organic carbon content is provided below. NOEC SQB_s normalized to 1 percent TOC are also presented below to enable for comparisons with other sources of sediment benchmarks.

Parameters	ESB Source	ESB ($\mu\text{g}/\text{kg}$ oc)	SQB _{NOEC} ($\mu\text{g}/\text{kg}$ dw) @ 3.5% TOC	SQB _{NOEC} ($\mu\text{g}/\text{kg}$ dw) @ 1.5% TOC	SQB _{NOEC} ($\mu\text{g}/\text{kg}$ dw) @ 1% TOC

Appendix F

Documentation of Upper Confidence Limit of the Mean (UCL_{mean}) Calculations

Table F1
Upper Confidence Limit of the Mean Concentration (UCL_{Mean}) - Descriptions of ProUCL 5.1 Calculation Methods
Revised Salem Canal Screening-Level Ecological Risk Assessment
Chemours Chambers Works, Deepwater, New Jersey

EPA ProUCL 5.1 Software Upper Confidence Limit (UCL) Method	Description
95% Adjusted Gamma UCL	95% UCL based upon adjusted gamma distribution
95% Chebyshev (Mean, Sd) UCL	95% UCL based upon Chebyshev inequality
95% H-UCL	95% UCL based on Land's H-statistic
95% KM (BCA) UCL	95% UCL based upon Kaplan-Meier estimates using biased-corrected accelerated bootstrap method (BCA)
95% KM (Chebyshev) UCL	95% UCL based upon Kaplan-Meier estimates using Chebyshev inequality
95% KM (Percentile Bootstrap) UCL	95% UCL based upon Kaplan-Meier estimates using percentile bootstrap method
95% KM (t) UCL	95% UCL based upon Kaplan-Meier estimates using the Student's t-distribution critical value
95% Student's-t UCL	95% UCL based upon Student's-t distribution
97.5% KM (Chebyshev) UCL	97.5% UCL based upon Kaplan-Meier estimates using Chebyshev inequality
99% KM (Chebyshev) UCL	99% UCL based upon Kaplan-Meier estimates using Chebyshev inequality

Note:

Further details on UCL_{mean} calculation methods provided in *ProUCL Version 5.1 User Guide* (EPA, 2015).

Table F2
Upper Confidence Limit of the Mean Concentration (UCL_{Mean}) - Former Seep Area Bulk Sediment
Revised Salem Canal Screening-Level Ecological Risk Assessment
Chemours Chambers Works, Deepwater, New Jersey

Constituent	Number of Samples	Number of Detections	ProUCL 5.1 Suggested Upper Confidence Limit (UCL) Method	UCL Value
0-0.5-foot Sampling Interval				
Volatile Organic Compounds (µg/kg)				
1,2-Dichlorobenzene	70	16	95% KM (t) UCL	181
1,3-Dichlorobenzene	70	14	95% KM (t) UCL	79.8
1,4-Dichlorobenzene	70	36	97.5% KM (Chebyshev) UCL	969
2-Chlorotoluene	70	8	95% KM (t) UCL	7.06
4-Chlorotoluene	70	3	95% KM (t) UCL	2.57
4-Isopropyltoluene	70	5	95% KM (Chebyshev) UCL	24.1
Acetone	70	50	95% KM (BCA) UCL	329
Carbon Disulfide	70	51	95% KM (Chebyshev) UCL	176
Cumene	70	4	95% KM (t) UCL	8.05
Methyl Ethyl Ketone	70	43	95% KM (BCA) UCL	51.4
Benzene	70	25	95% KM (Chebyshev) UCL	58.0
Chlorobenzene	70	67	97.5% KM (Chebyshev) UCL	8609
Meta- And Para-Xylene	70	9	95% KM (t) UCL	7.87
Ortho-Xylene	70	3	95% KM (t) UCL	4.88
Toluene	70	20	95% KM (Chebyshev) UCL	73.9
Xylenes	70	9	95% KM (t) UCL	8.24
Semi-Volatile Organic Compounds (µg/kg)				
1,2,4-Trichlorobenzene	70	3	95% KM (t) UCL	25.0
1-Naphthylamine	70	5	95% KM (t) UCL	393
2-Chlorophenol	70	3	95% KM (t) UCL	26.4
2-Naphthylamine	70	2	95% KM (t) UCL	312
2-Methylnaphthalene	70	44	95% KM (BCA) UCL	41.7
4-Methylphenol (P-Cresol)	70	2	95% KM (t) UCL	24.2
